Getting access keys for the Utah City social accounts

What this is. We want to see how Utah City's posts perform (views, likes, followers) in one place. Each social platform lets an account owner create an **access key**: a long code that works like a visitor badge. It lets our dashboard *look at* the numbers and nothing else. It cannot post, delete or message anyone.

Rule for every platform: whenever you are asked which permissions to allow, choose only the ones that say **read**, **view**, **insights** or **analytics**. Never choose anything that says post, publish, upload, manage or write.

Time needed: about 20 minutes per platform. TikTok and LinkedIn must approve your request first, which can take days, so **do those two first**, then do the rest while you wait.

Details you will be asked to type in

When a form asks for...	Type or paste this
App name	Utah City Analytics
Website	https://www.utahcity.app
Privacy policy link	https://www.utahcity.app/privacy
Terms of service link (or support link)	https://www.utahcity.app/support
What will you use this for? (description)	We read the performance numbers of our own account and show them in an internal dashboard. We do not post or collect other people's data.
Return link (also called redirect or callback link)	`https://www.utahcity.app/api/owned-social/callback/tiktok` (replace the last word with linkedin, youtube or x for those platforms)

1. TikTok (@utahcityutah)

1. Go to `developers.tiktok.com` and log in with the Utah City TikTok account. Follow the prompts to register as a developer.
2. Click **Manage apps**, then **Connect an app**.
3. Fill in the form using the table above: name, a short description, the Utah City logo, the privacy link, the terms link, and the website. Choose **Web** as the platform.
4. Click **Add products** and pick **Login Kit**. Paste the TikTok return link from the table.
5. When it asks which information you want to see, tick these four (all are read-only): **user.info.basic**, **user.info.profile**, **user.info.stats**, **video.list**. For the "why" box under each, paste the description from the table.
6. Upload the short demo video Jacob sends you, then click **Submit for review**. TikTok will email you when it is approved.

> **Copy these into the shared folder Jacob gave you:** the **Client Key** and **Client Secret**. Find them by opening your app in Manage apps, under **App details**.

2. LinkedIn (Utah City company page)

You must be a **Super Admin** of the Utah City page. Ask Jacob if you are not sure.

1. Go to `linkedin.com/developers` and click **Create app**.
2. Enter the name, choose **Utah City** as the LinkedIn Page, paste the privacy link, and upload the logo. Click **Create app**.

3. Open the **Settings** tab and click **Verify** next to the company page. LinkedIn gives you a link; open it (or send it to another Super Admin) and click approve.
4. Open the **Products** tab, find **Community Management API**, and click **Request access**. Fill out the short form using the description from the table. Do not request any other product on this app. LinkedIn will email you when it is approved.
5. Open the **Auth** tab. Under **OAuth 2.0 settings** click the pencil, then **Add redirect URL**, and paste the LinkedIn return link. Save.

> **Copy these into the shared folder Jacob gave you:** the **Client ID** and **Primary Client Secret** shown on the **Auth** tab.

3. Facebook and Instagram (one set of keys covers both)

Before you start: in the Instagram app, make sure the account is a **Business** or **Creator** account (Settings, then Account type and tools) and that it is connected to the Utah City Facebook Page.

1. Go to `developers.facebook.com` and log in with a Facebook account that is an **Admin** of the Utah City Page. Click **Get Started** if you are asked to register.
2. Click **My Apps**, then **Create App**. Enter the name and your email. When asked what the app will do, pick the options about **Facebook Pages** and **Instagram**. If you must choose a type, pick **Business**. Link it to the Utah City business account when asked.
3. Open **App settings**, then **Basic**. Paste the privacy link into the privacy field, and note the **App ID** and **App Secret** (click **Show**).
4. Next, go to `business.facebook.com/settings`. In the left menu click **Users**, then **System users**, then **Add**. Name it *Utah City Analytics Reader* and choose the role **Employee**. (This is a robot login that only reads numbers.)
5. Click the new user, then **Add assets**. Choose the Utah City **Page** and the Utah City **Instagram account**, and give each **view** or **insights** access only. Save.
6. Click **Generate token**. Pick the Utah City Analytics app and the longest expiry offered. Tick only: **pages_show_list**, **pages_read_engagement**, **read_insights**, **instagram_basic**, **instagram_manage_insights**. Click **Generate** and **copy the token right away**; it only appears once.

> **Copy these into the shared folder Jacob gave you:** the **App ID**, **App Secret**, the **token**, and the **Facebook Page ID** (on the Facebook Page, open **About** and scroll to the bottom).

4. YouTube (@UtahCity)

Use a Google account that is an **Owner** or **Manager** of the Utah City YouTube channel.

1. Go to `console.cloud.google.com` and log in. Click the project menu at the top, then **New project**. Name it *Utah City Analytics* and click **Create**.
2. In the left menu choose **APIs and Services**, then **Library**. Search for **YouTube Data API v3** and click **Enable**. Do the same for **YouTube Analytics API**.
3. In the left menu choose **OAuth consent screen** (it may be called **Google Auth Platform**). Pick **External**, enter the app name and your email, and when asked about permissions add the two that end in **readonly**: **youtube.readonly** and **yt-analytics.readonly**.
4. On the same screen click **Publish app**. (If you skip this, the connection stops working after 7 days.)
5. In the left menu choose **Credentials**, then **Create credentials**, then **OAuth client ID**. Choose **Web application**, and under **Authorized redirect URIs** paste the YouTube return link. Click **Create**.
6. Click **Download JSON** on the box that appears.

> **Copy these into the shared folder Jacob gave you:** the downloaded **JSON file**.

5. X (@utahcityutah)

1. Go to `console.x.com` and log in as the Utah City X account. Sign up for developer access and paste the description from the table when it asks how you will use it.
2. Open **Billing** and add a small amount of credit, for example $10 (X now charges a tiny amount each time numbers are read). If there is a **spending limit** option, turn it on, and turn automatic top-up off.
3. Create a **Project**, then an **App** inside it, named Utah City Analytics.
4. In the app, find **User authentication settings** and click **Set up**. Choose **Read** permission (not Read and write), choose **Web App** as the type, paste the X return link and the website, and save.
5. Open the **Keys and tokens** tab and click **Generate** for the API Key and Secret and for the Bearer Token. **Copy each one immediately**; X only shows them once.

> **Copy these into the shared folder Jacob gave you:** the **API Key**, **API Secret**, **Bearer Token**, and the OAuth 2.0 **Client ID** and **Client Secret**.

Finally

Tell Jacob when each platform is done (and when TikTok and LinkedIn approve you). He will then send you a **Connect** link for each one. Click it, log in as the account owner, and click **Allow**. That is the last step.
